

3D printed definitive restorations in everyday practice

Online seminar with Dr José Gabriel Martínez

Nowadays, the dental practitioners have the opportunity to apply different devices in order to offer Digital Dentistry to their patients. The 3D-printing revolution allows lab technicians and clinicians to manufacture models, temporaries/definitive restorations, surgical guides, individual impression trays and more.

In this Web-Seminar, Dr. José Gabriel Martínez (Spain) will present the advantages of the 3D-printing technology compared to other digital approaches and will show how to use it in the daily practice. Besides, he will explain how this technology has become a MUST in different kind of treatments. In addition, the different applications of BEGO's VarseoSmile CrownPlus in everyday practice will be presented.

At the end of the presentation, the participants will have the chance to join a Question&Answer session with the speaker.
